

Details of New server

Hi Asha-ram

he plesk access is via

you can access the plesk here :

<https://s15227850.onlinehome-server.info:8443>

User: gijsbrecht
Pass: sumschool01

The path to our web is now :

/srv/www/vhosts/materialknowledge.org/httpdocs/

I haven't figured out how to have ftp yet to our files! (let me know if you figure it out)

someone pointed out that docman is not working at the moment, I am looking at it.

cheers

Mark

Hi Paul, Hi Anne

The requested Domain has been registered and the server is accessible now

over the following adress:

<http://web17.p15160654.pureserver.info>

<http://www.materialsknowlege.org>

// As soon the domain is through the registration process you can access

your server over its domainname but till then you have to use the first one

(the real one). I guess its gonna take from 1-5 days till reg process is completed

Administration

<https://web17.p15160654.pureserver.info>

<https://www.materialsknowlege.org>

// !your root user

User: web17

Password: 3gUqSI3b

//!You have to accept the security certificate to acces the adminpage of your server

If your planning to use the mail services provided with your server you

can also log in with your accountname

(on the adminpage) and you will be redirected to a HORDE Client which can be

accessed from everywhere

If your having trouble with something feel free to contact me under one of

the following options:

enjoy

cheers

Markus

To access the backend of the web pages:

Admin

Dsel73hen

Hi Asha-ram,

I moved the 3 webspaces :

1. materialknowledge.org here you need to create & import the databases that you backed up today
2. microstructure.info as far as i can see this one is finished too
3. structural-geology.info (nothing more to be done here since there is only a redirecting HTML file there .)

HowTo:

1st you go here --> <https://s15227850.onlinehome-server.info:8443>

login:

User: gijsbrecht

PW: changemepls

Then click on the "home" link in Menu(leftside)

click on materialsknowledge.org now you should see a button "

"Databases" Here you can add new databases

Add 1 and give it a name (best would be to use the same name like the old databases and add a database user and password after.

Write down databasename databaseusername database password!

Now use the DB WebAdmin which should appear after you created a database and import the SQL files you have from the old databases

Do this for all 4 Databases.

next step is to check the config files of the websites and update the database name username and password so that they can connect to the fresh imported databases.

Inform me after this is done so i will change the DNS to the IP of the new server and all should work fine.

To your question of the last mail about the code. Evry database has a database username and database access code which u need to define in a config file of joomla , moodle or what ever webapplication you use so it can connect to the db server . On the old server all your databses have the same username and same password. This is not possible on the new server usernames have to be different.

best would be to name the databases after the project they belong to so its easier to identify them ...

Best thing would also be to write down all 4 database accesses informations and mail it to Paul after it is done so he has all access codes.

Ill be in Hospital tomorrow afternoon but will be working on my computer as soon as im back home

If you have any problems feel free to send me a mail or contact me via skype as long my little son lets me work i will help :)

Cheers

Markus

yes you need to modify the path

/srv/www/vhosts/materialknowledge.org/httpdocs
